

360EDITOR inMap

(Development of a Digital System for Structural Data Management and Mapping)

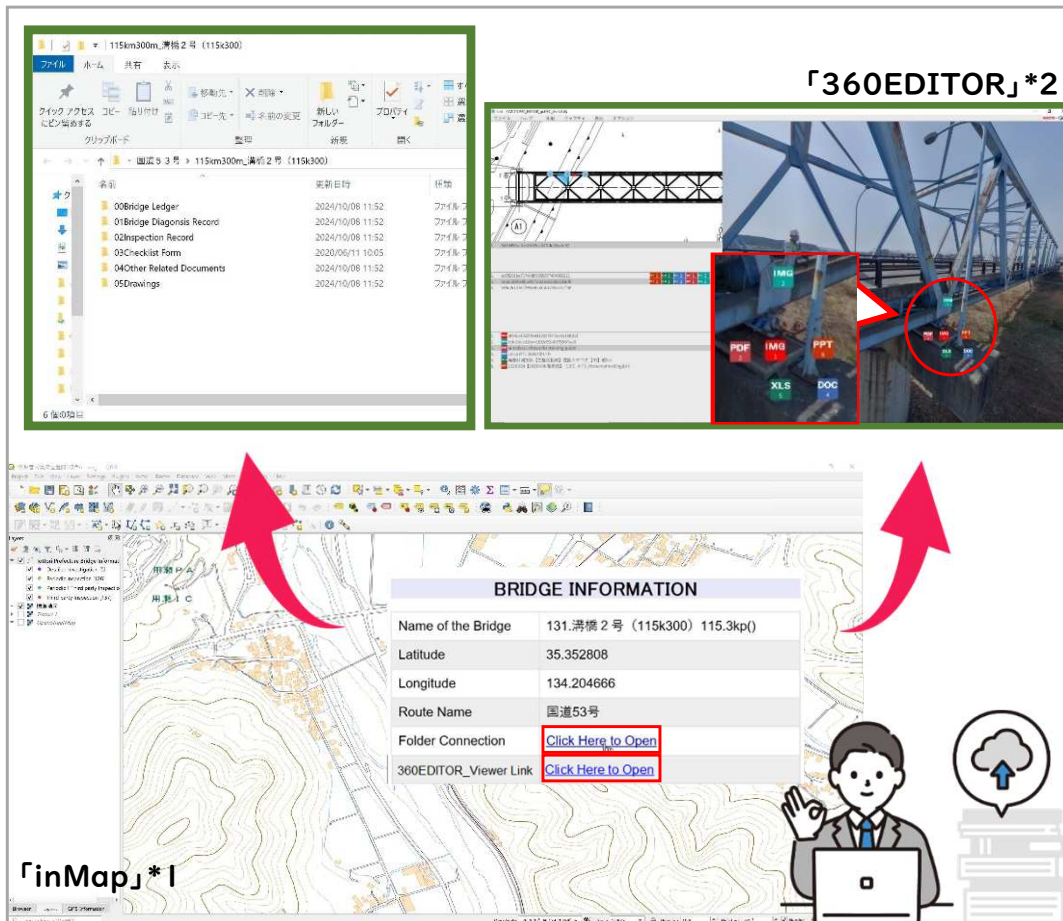

Eight-Japan Engineering Consultants Inc.

Abstract

“inMap” is a management system that links data folders for each structure on an electronic map. It simplifies the organization and management of the increasing amount of documentation, enabling quick retrieval of necessary data, while saving time and effort.

“360EDITOR” is a document management and presentation system that allows the attachment of various data within 360-degree photos. Unlike BIM, it enables quick model creation with a reduced data file size.

By integrating the “360EDITOR Viewer” into “inMap,” it becomes possible to view not only the structural data on the map but also the entire facility in 360 degrees, making it useful for interactive, street-view-like visualization and enhances comprehensive facility management.

- *1. You can open Windows® Explorer on the map, making it easy to quickly find related data !
- *2. Various data (PDF, Word, Excel, etc.) can be attached to 360-degree images !
